

I noticed that I use AI in many places in my daily life, sometimes without even realizing it. For example:

1. **YouTube** – It recommends videos based on what I watch, search and like.
2. **Google Maps** – It uses AI and traffic data to suggest routes and estimate travel time.
3. **Instagram** – The Reels and posts shown to me are recommended according to my interests and previous activity.
4. **Google Search** – It understands what I am searching for and tries to show the most relevant results.
5. **ChatGPT** – I use it for studying, understanding difficult topics, coding and getting ideas.
6. **Google Photos** – It can recognize people, places and objects in photos and makes them easier to search.
7. **Spotify/YouTube Music** – It suggests songs and playlists based on the type of music I usually listen to.
8. **Face Unlock** – My phone uses AI-based facial recognition to identify me and unlock the device.
9. **Gmail** – AI helps filter spam and suspicious emails and also gives smart reply suggestions.
10. **Online Shopping** – Websites recommend products based on things I have searched for or viewed before.

At Last:

After doing this activity, I realized that AI is already a normal part of my everyday life. I use it for entertainment, studies, travel, communication and even security, often without consciously thinking about it as AI.
